| A.1 SPECIFIC CONDITIONS | | |
| 1 | Leak detection and Repair (LDAR) program shall be prepared and implemented as per the CPCB guidelines. | <p>Complied.</p> <p>The unit has implemented the LDAR program during plant operation as per CPCB guidelines. Unit will ensure the below listed conditions for LDAR program, Approaches for controlling fugitive emissions from equipment leaks shall have proper selection, installation and maintenance of non-leaking or leak-tight equipment. Following initial testing after commissioning, the monitoring for leak detection is to be carried out as a permanent on-going Leak Detection and Repair (LDAR) programme. Finally detected leaks are to be repaired within an allowable time frame. Components that shall be covered under LDAR programme include (i) Block Valves; (ii) Control Valve; (iii) Pump seals; (iv) Compressor seals; (v) Pressure Relief Valves; (vi) Flanges - Heat Exchangers; (vii) Flanges - Pipings; (viii) Connector - Pipings; (ix) Open ended lines; (x) Sampling connections. Equipment and line sizes more than 1.875 cm or 3/4 inch are to be covered. Monitoring Requirements and Repair Schedule: Following frequency of monitoring of leaks and schedule for repair of leaks shall be followed as attached in annexure. In addition, any component observed to be leaking by sight, sound or smell, regardless of concentration (liquid dripping, visible vapor leak) or presence of bubbles using soap solution should be considered as a leak. The percentage leaking components should not be more than 2percent for any group of components, monitored excluding pumps/compressors. In case of pumps/compressors, it should be less than 10percent of the total number of pumps/compressors or three pumps and compressors, whichever is greater. Pressure relief and blowdown systems should discharge to a vapor collection and recovery system or to flare. Open-ended lines should be closed by a blind flange or purged. A complete closed-loop should be used in all routine samples. Low emission packing should be used for valves. High integrity sealing materials should be used for flanges. As per CPCB guidelines, the unit has installed Instrumental methods for measurement of VOC detection at various locations to identify leak detection in plant areas to arrest on priority basis. Please find attached plant layout for devices attached as Annexure-1</p> <p><u>Annexure-1</u></p> |
| 2 | Close loop solvent recovery system with an adequate condenser system shall be provided to recover solvent vapors in such a manner that recovery shall not be less than 98 percent and recovered solvent shall be reused in the process within premises. | <p>Complied</p> <p>The unit has set up a Close loop solvent recovery system along with an extraction column and with help of right chemistry with correct plant design, the unit is reusing 98percent recovered solvent for further process within premises.</p> |

As shown in table, in the extraction stripper column required total feeding of solvent as per feed rate 7600 kg/hr, after distillation process we are getting recovery from stripper 7448 kg/hr (98percent). This is a continuous process.

Process description for solvent recovery In the Process

The aqueous reactor phase is contacted with recycled sol-1 in the extraction column, which removes unreacted RM, byproduct from the aqueous phase. Organic phase from the extraction column top is then directed to organic isolation for recovery. In this section sol-1 and by-product separate out in a flash vessel followed by a Splitter column, where sol-1 is recycled back to the extraction column, and aqueous phase from the bottom of the extraction column is then directed to aqueous isolation for recovery. In this section sol-2 and final product separate out in a flash vessel followed by thin film evaporator, where sol-2 is recycled back to the reactor for reaction.

| | | <p>arrested material is removed manually and then will be disposed off suitably.</p> <p>b) Oil & Grease trap: effluent contains oil & grease. This oil & grease if not removed then creates the problem of scum accumulation and affects the functioning of microbes in aeration tanks. To avoid this, an oil & Grease chamber is provided after the bar screen, where oil & grease is arrested prior to entry into the plant. Accumulated oil removed and disposed of properly.</p> <p>c) Equalization : To absorb variation in quantity and quality of effluent and to provide uniform flow at the downstream treatment process, a collection or equalization tank is provided. This will avoid shock loading and process upsets of the treatment plant.</p> <p>d) Neutralization: Neutralization system is provided to neutralize the effluent using lime slurry.</p> <p>e) Flash Mixer, Flocculator & Tube settler - Installed as part of primary treatment to remove suspended solid.</p> <p>f) De-watering system (Filter Press)- Bottom of primary & secondary tube settler is passed through filter press. The generated sludge was disposed of at the TSDF site.</p> <p>2. SECONDARY TREATMENT</p> <p>ASP – ACTIVATED SLUDGE PROCESS (AERATION) : This is the main section of the plant where degradation of organic pollutants with the help of aerobic microorganism takes place. In aeration tank activated biomass is developed in such a way that certain MLSS is maintained for continuous effluent flow which comes to the aeration basin. Effluent is degraded in given retention time and activated sludge is further passed to tube settler and recycled as per requirement. The sludge, which is not required after recirculation, is sent to the filter press. The air supply arrangement is provided for maintaining proper DO.</p> <p>3. TERTIARY TREATMENT Secondary treated water passed through the sand media filter followed by an activated carbon filter. Filtered water will be collected in the treated water tank from where it will be sent to the GIDC drainage line for disposal.</p> <p>Details of equipment are mentioned in the Point No. 12.</p> |

Annexure - 5

DETAIL OF EFFLUENT TREATMENT PLANT (125 KLD):-

We have installed an ETP consisting of primary, secondary & tertiary treatment. Treated water is being discharged to the GIDC drainage line.

1. PRE & PRIMARY TREATMENT

Screening: This is the first unit of the plant in which large or floating materials in the effluent gets arrested and blockage or choking of the downstream equipment can be avoided. This arrested material removed manually and then will be disposed off suitably.

Oil & Grease trap: effluent contains oil & grease. This oil & grease if not removed then creates the problem of scum accumulation and affects the functioning of microbes in aeration tank. To avoid this, oil & Grease chamber is provided after the bar screen, where oil & grease is arrested prior to entry in the plant. Accumulated oil removed and disposed of properly.

Equalization : To absorb variation in quantity and quality of effluent and to provide uniform flow at the downstream treatment process, a collection or equalization tank is provided. This will avoid shock loading and process upsets of the treatment plant. **Neutralization:** Neutralization system is provided to neutralize the effluent using lime slurry.

Flash Mixer, Flocculator & Tube settler - Installed as part of primary treatment to remove suspended solid.

De watering system (Filter Press) - Bottom of primary & secondary tube settler is passed through filter press. The generated sludge disposed of at the TSDF site.

2. SECONDARY TREATMENT

ASP – ACTIVATED SLUDGE PROCESS (AERATION) :

This is the main section of the plant where degradation of organic pollutants with the help of aerobic microorganism takes place. In aeration tank activated biomass is developed in such a way that certain MLSS is maintained for continuous effluent flow which comes to the aeration basin. Effluent is degraded in given retention time and activated sludge is further passed to tube settler and recycled as per requirement. The sludge, which is not required after recirculation, is sent to the filter press. The air supply arrangement is provided for maintaining proper DO

3. TERTIARY TREATMENT

Secondary treated water passed through the sand media filter followed by an activated carbon filter. Filtered water will be collected in the treated water tank from where it will be sent to the GIDC drainage line for disposal.
